

In this application, there is an Employee.java class that contains the variables employee name, Id, email, and salary. There is another class called FileHandler.java which reads a file called FileToRead.txt containing employee data and puts the data in a Array list and displays them into the console using the display method. This class also takes the data in the Array list and appends it into a file called FileAppend.txt.

Finally, there is a main class called FileMain.java which creates the object of type FileHandler and invokes the readFromFile method which takes in the file path to read the employee data. The appendData method is also called which takes in the file in which the data is append to.
